

Machine Learning and Pattern Classification - UE

Data Exploration - Conclusion

Task 3
Simon Grundner, Mihael Zupanic
Institute of Computational Perception

Annotation Biases

- Most files only have a single annotator → Lack of verification
- Demographics and cultural bias
- Definition of a “typical household”?
- Habits, routines and housing conditions affect the interpretation of scenarios.
- The implication of a scenario just by a series of audio queues can lead to false assumptions.
- Example: Clicking sound after opening a door.

Broader impact of public available data

- Development of new applications for accessibility, safety and security
- Highest accident rate in households.
- Detect accidents and take action immediately
- Detect hazards like gas leaks.

Broader impact of public available data

- Concern for normalization of surveillance.
- Enforcement of these systems as a security standard is not acceptable by everyone.
- Promote ethical use by enforcing a license.
- Specify restrictions and use conditions.
- Ensure anonymity so that no personal information is leaked.
